

We don't sell trails. We sell keeping them alive.

A trail is cheap to make. The value, and the revenue, is in keeping a team's understanding current as the code keeps changing.

Free to start

Public trails, solo use. Engineers make and share them with zero friction. This is the wedge, not the revenue.

Teams pay to keep them

\$15 per seat. Private trails, a searchable archive, and trails that stay current as the codebase moves. The understanding doesn't go stale.

The archive compounds

Every trail a team keeps is verified understanding that accumulates. The more they use it, the more it's worth, and the harder it is to leave.

The model: free trails get us in. Teams pay to keep their understanding current and searchable. Maintenance is the recurring revenue.

Then we bind the ones that matter to runtime.

A Code Trail captures what a human expected. Convert it to a Principal File and OpenTelemetry checks live behavior against that expectation, continuously.

This is the Enterprise tier. Humans verify intent. OTel verifies behavior. Teams pay the most for the trails that run in production, where being wrong actually costs something.

Two revenue engines, one artifact.

The same trail earns twice. We charge to keep understanding current, and again to bind it to production. One compounds, the other commands premium.

MAINTAIN

The recurring base

Teams pay per seat to keep their trails current and searchable.
Grows with every team and every trail kept. The archive compounds and locks in.

Volume · many teams, low friction, compounding

BIND TO RUNTIME

The premium layer

Convert the trails that matter into Principal Files, bound to runtime with OTel.
Enterprise pricing. Governance, audit, and verification where being wrong is expensive.

Value · fewer customers, high stakes, premium price

Land with maintenance. Expand with runtime. Adoption builds the compounding base; the trails that reach production become the premium tier. Tribal knowledge to trails to telemetry.
